Number of Stories 2

Injectors Direct, a testing and refurbishing company of diesel fuel injection parts in San Luis Obispo, invested in a new state-of-the-art facility. The design vision of the facility created a versatile, attractive building that complements and revitalizes the commercial neighborhood.

The owner and design team evaluated several exterior envelope options and chose an exterior load bearing concrete masonry unit (CMU) wall system with charcoal color units and black aggregates.

Burnished and precision masonry units, 8-inch, 10-inch and 16-inch with over 26 different CMU components were used in construction of the building, adding both structural and architectural merit to the project. The bright red metal panels and red bands framing the windows and front door complement the CMU, resulting in a strikingly colorful fresh image of sophistication and style. Injectors Direct is a positive signature building for the area.
