Design of the new Central Coast Truck Center included different colors and textures of concrete masonry units (CMU). CMU provide the structural wall strength and flexibility to provide the large openings and space needed to supply parts, service, and sales for the California Central Coast trucking industry.

Various earth-tone colors contrast providing a blend of masonry wall finishes. The color contrast is further enhanced by texture variation that includes precision, split face, and multiple scored split-face masonry units. The use of gray precision masonry units in the sales department offers an attractive contemporary appearance for visitors.

The prominent character and identity of the trucking facility is a magnetic focal point for truck drivers. Masonry units were chosen for this project for their long-term durability, exceptional benefit of thermal performance and local availability.
