The renovated Westminster Corporation Yard used concrete masonry units (CMU) which serve as the primary building material for a new administration building, fuel station and warehouse facilities.

Tan precision block units were incorporated in the masonry design, in a stack bond pattern, with a red CMU split face band. Tan precision units were also used for the planters, contributing to the architectural character and aesthetics of this maintenance facility.

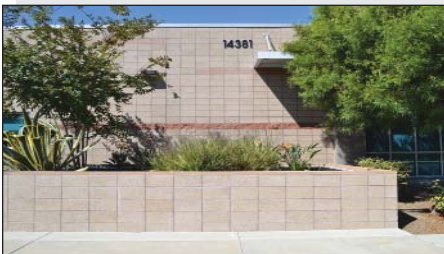

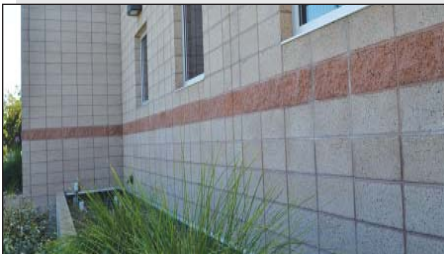

Selecting of a structural building system whose main property is durability should be a principal consideration and concrete masonry units are an obvious choice for any structure. CMU affords an economical and durable wall system that is impact-resistant and easily maintainable.

CMU as the main exterior skin of the building creates an energy efficient interface with the elements which were extended with eco-friendly landscaping.
